

S.4 Chemistry

Class practice 3 (Methods of preparing soluble and insoluble salt) (Suggested answer)

Name: \_\_\_\_\_ Class: 4\_\_ ( ) Date: \_\_\_\_\_

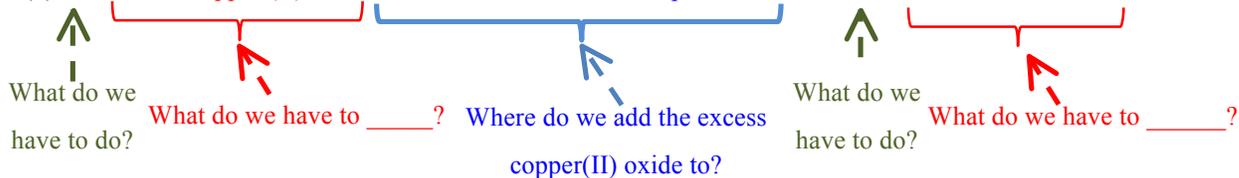

**(A) Preparation of the soluble salt such as  $\text{CuSO}_4$**

Experimental procedures for preparing a soluble salt such as  $\text{CuSO}_4$

Standard pattern in writing experimental procedures

Step (1) & (2) Add excess copper (II) oxide to the beaker with dilute sulphuric acid and heat the reaction mixture.

Step (3) & (4) Filter the excess copper (II) oxide (in order) to obtain the copper (II) sulphate solution

Instruction: Below are the remaining procedures for preparation of  $\text{CuSO}_4$ . Use green, red and blue highlighter or ball pen to underline different parts in each step according to the patterns shown in step 1-4.

Step (5) Heat the copper (II) sulphate solution

(in order) to concentrate the solution

until a saturated copper (II) sulphate solution is formed

Step (6) Leave the saturated copper (II) sulphate solution at room temperature overnight

Step (7) Filter the copper (II) sulphate solution

(in order) to obtain the crystal

Step (8) Wash the crystals with a little cold distilled water

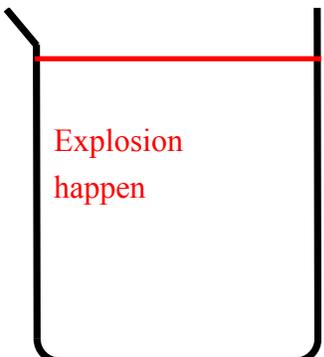

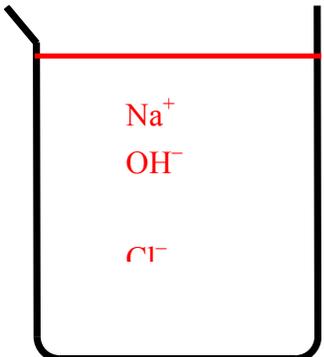

Step (9) Dry the crystals

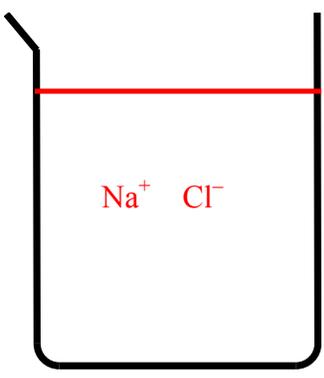

using filter paper

### **(B) Preparation of soluble salt such as NaCl**

Decide which of the following methods is suitable for making pure sodium chloride solution

Aim: To prepare a pure solution of NaCl so that we can use it directly for producing the salt through crystallization.

<p><b>Method 1:</b> excess Na + dilute <math>\text{H}_2\text{SO}_4</math></p> <p>Did any reaction occur? <u>Yes / No</u></p> <p>Chemical equation(if yes): <u><math>2\text{Na} + \text{H}_2\text{SO}_4 \rightarrow \text{Na}_2\text{SO}_4 + \text{H}_2</math></u></p> <p>Did a pure salt form? <u>Yes / No</u></p> <p>Why? <u>The reaction is too vigorous and explosion will happen.</u></p> <p>Is it a suitable method? <u>Yes / No</u></p>	<p>After mixing excess Na with HCl, what ions are left behind?</p> 
<p><b>Method 2:</b> excess NaOH + dilute <math>\text{H}_2\text{SO}_4</math></p> <p>Did any reaction occur? <u>Yes / No</u></p> <p>Chemical equation(if yes): <u><math>2\text{NaOH} + \text{H}_2\text{SO}_4 \rightarrow \text{Na}_2\text{SO}_4 + \text{H}_2\text{O}</math></u></p> <p>Did a pure salt form? <u>Yes / No</u></p> <p>Why? <u>The product, <math>\text{Na}_2\text{SO}_4(\text{aq})</math> will mix up with the excess NaOH as NaOH is also soluble in water.</u></p> <p>Is it a suitable method? <u>Yes / No</u></p>	<p>After mixing excess NaOH with HCl, what ions are left behind?</p> 

<p><b>Method 3: Same amount of dilute NaOH + same amount of dilute H<sub>2</sub>SO<sub>4</sub></b></p> <p>Did any reaction occur? <u>Yes / No</u></p> <p>Chemical equation(if yes): <math>2\text{NaOH} + \text{H}_2\text{SO}_4 \rightarrow \text{Na}_2\text{SO}_4 + 2\text{H}_2\text{O}</math></p> <p>Did a pure salt form? <u>Yes / No</u></p> <p>Why? <b>When ALL NaOH reacts with H<sub>2</sub>SO<sub>4</sub>, only the product, Na<sub>2</sub>SO<sub>4</sub>(aq) remains in the solution.</b></p> <p>Is it a suitable method? <u>Yes / No</u></p>	<p>After mixing same amount of NaOH and HCl, what ions are left behind?</p> 
---	---

**Summary**

Method 3 (**Same amount of dilute NaOH + same amount of dilute H<sub>2</sub>SO<sub>4</sub>**) can produce **pure** Na<sub>2</sub>SO<sub>4</sub>(aq) for making pure Na<sub>2</sub>SO<sub>4</sub>(s) after **further treatment**.

**Question to think about:**

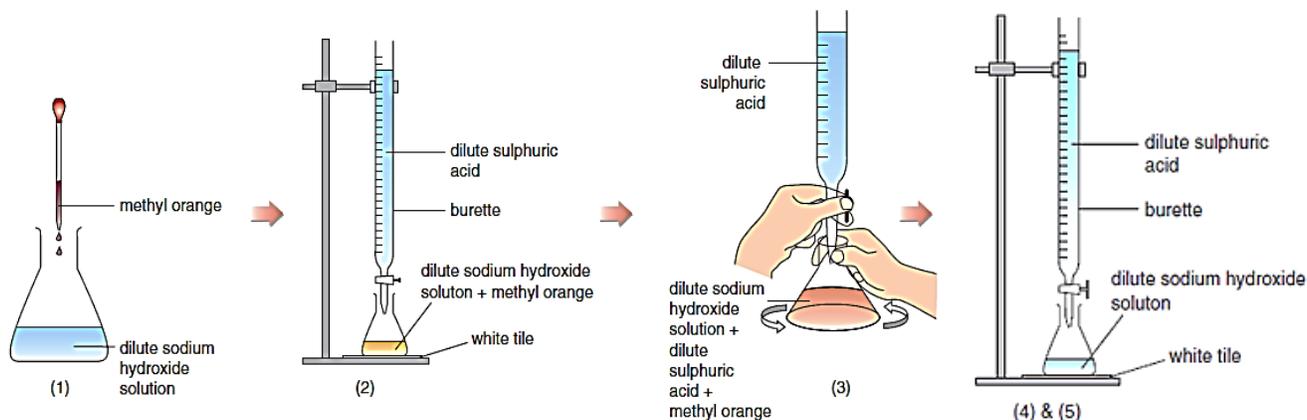

Suggest TWO salts, other than Na<sub>2</sub>SO<sub>4</sub>(s), that require the same method for their preparation.

**Any kind of salt which contains Na<sup>+</sup>, K<sup>+</sup>, group I metal ion or NH<sub>4</sub><sup>+</sup>.**

**General method of producing soluble salt such as \_\_\_\_\_, \_\_\_\_\_ and \_\_\_\_\_**

**Same amount of acids + same amount of alkalis**

**Writing experimental procedures for preparing a soluble salt such as NaCl**

Step	What action do we have to do?	What do we have to (do)?	Where/When/How do we do it?
(1)	Add	a known volume of <u>dilute sodium hydroxide solution</u>	in a <u>conical flask</u>
	Add	<u>a few drops of indicator</u>	to the <u>sodium hydroxide solution</u>
(2) & (3)	Add	<u>dilute hydrochloric acid</u>	into the flask
		(Until) <u>the indicator just changes</u>	
(4) & (5)	Repeat	<u>the experiment</u>	with <u>same</u> volumes of acids and alkalis but without <u>indicator</u>

After the above steps, a pure Na<sub>2</sub>SO<sub>4</sub>(aq) is

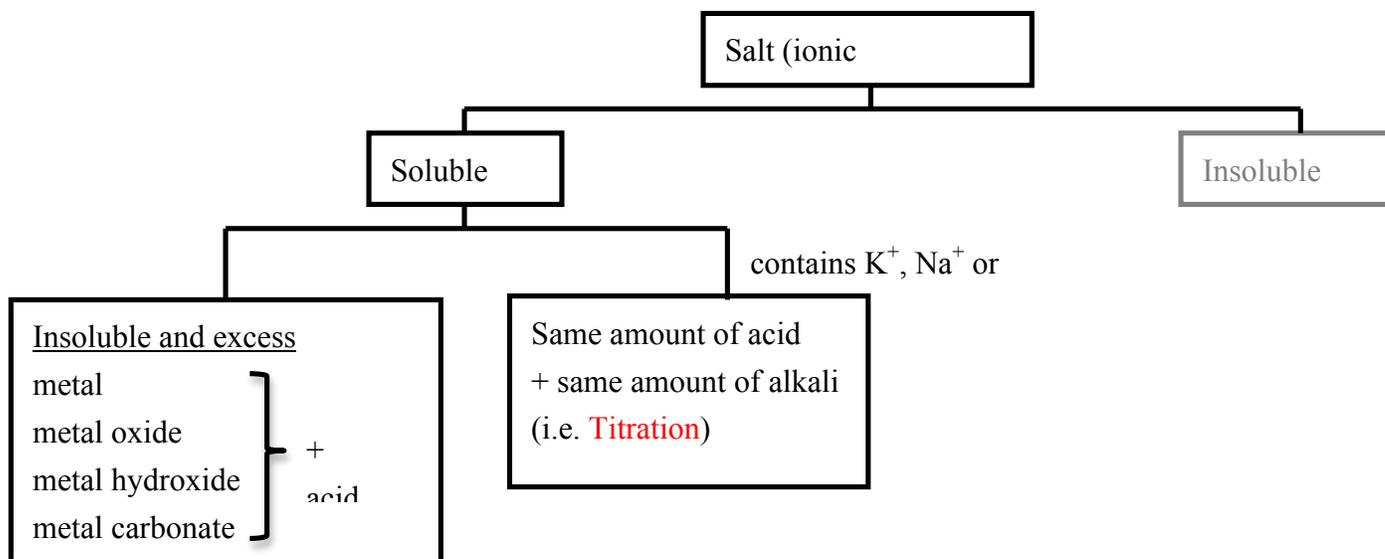

**What are the next steps for obtaining pure Na<sub>2</sub>SO<sub>4</sub>(s)?**

Try to write the procedures for the remaining part according to the standard structures of writing experimental procedures.

Heat **the solution (to)** concentrate **the solution (until)** a **saturated solution** is formed. **Then,** Filter **the solution**

**(to)** obtain **the crystals**. Wash **the crystal** with a little cold distilled water. Dry **it** using **filter paper**.

### Summary of the first two methods of making soluble salt

#### Checkpoint – Suggest a suitable method for preparing particular salt

Give a pair of reactants to prepare each of the following **soluble** salts

	Salt to be prepared	Reactants to prepare the salt
E.g.	MgCl <sub>2</sub>	Excess MgO + dilute HCl
(a)	NH <sub>4</sub> NO <sub>3</sub>	Same amount of NH <sub>3</sub> + HNO <sub>3</sub>
(b)	FeSO <sub>4</sub>	Excess Fe /FeO/FeCO <sub>3</sub> /Fe(OH) <sub>2</sub> + H <sub>2</sub> SO <sub>4</sub>
(c)	NaNO <sub>3</sub>	Same amount of NaOH + HNO <sub>3</sub>
(e)	ZnCl <sub>2</sub>	Excess Zn/Zn(OH) <sub>2</sub> /ZnO/ZnCO <sub>3</sub> + HCl

#### (C) Preparation of the insoluble salt such as PbSO<sub>4</sub>

Decide which of the following methods is suitable for making pure sodium chloride solution

Aim: To prepare a pure insoluble PbSO<sub>4</sub>

<p><b>Method 1:</b> Pb(NO<sub>3</sub>)<sub>2</sub> + Na<sub>2</sub>SO<sub>4</sub></p> <p>Did any reaction occur? <u>Yes / No</u></p> <p>Chemical equation(if yes): Pb(NO<sub>3</sub>)<sub>2</sub> + Na<sub>2</sub>SO<sub>4</sub> → PbSO<sub>4</sub> + 2NaNO<sub>3</sub></p> <p>Did a pure salt form? <u>Yes / No</u></p> <p>Why? A precipitate (PbSO<sub>4</sub>) is formed which is the only insoluble salt in the product. (Therefore, we call this process <u>precipitation</u>)</p> <p>Is it a suitable method? <u>Yes / No</u></p>	<p>What happen when we mix Pb(NO<sub>3</sub>)<sub>2</sub> and Na<sub>2</sub>SO<sub>4</sub>?</p>
---	---

<p><b>Method 2:</b> <math>\text{Pb} + \text{H}_2\text{SO}_4</math></p> <p>Did any reaction occur? <u>Yes / No</u></p> <p>Chemical equation(if yes): <math>\text{Pb} + \text{H}_2\text{SO}_4 \rightarrow \text{PbSO}_4 + \text{H}_2</math></p> <p>Did a pure salt form? <u>Yes / No</u></p> <p>Why? <math>\text{PbSO}_4(\text{s})</math> will form on the surface of Pb which is difficult them. Besides, reaction will stop after a while when the surface of Pb is fully covered with <math>\text{PbSO}_4</math>.</p> <p>Is it a suitable method? <u>Yes / No</u></p>	<p>What happen when we put <b>Pb</b> and <math>\text{H}_2\text{SO}_4</math>?</p> 
<p><b>Method 3:</b> <math>\text{Pb}(\text{OH})_2 + \text{H}_2\text{SO}_4</math></p> <p>Did any reaction occur? <u>Yes / No</u></p> <p>Chemical equation(if yes): <math>\text{Pb}(\text{OH})_2 + \text{H}_2\text{SO}_4 \rightarrow \text{PbSO}_4 + 2\text{H}_2\text{O}</math></p> <p>Did a pure salt form? <u>Yes / No</u></p> <p>Why? <math>\text{PbSO}_4(\text{s})</math> will form on the surface of <math>\text{Pb}(\text{OH})_2</math> which is difficult them. Besides, reaction will stop after a while when the surface of <math>\text{Pb}(\text{OH})_2</math> is fully covered with <math>\text{PbSO}_4</math>.</p> <p>Is it a suitable method? <u>Yes / No</u></p>	<p>What happen when we put <b>Pb</b> and <math>\text{H}_2\text{SO}_4</math>?</p> 

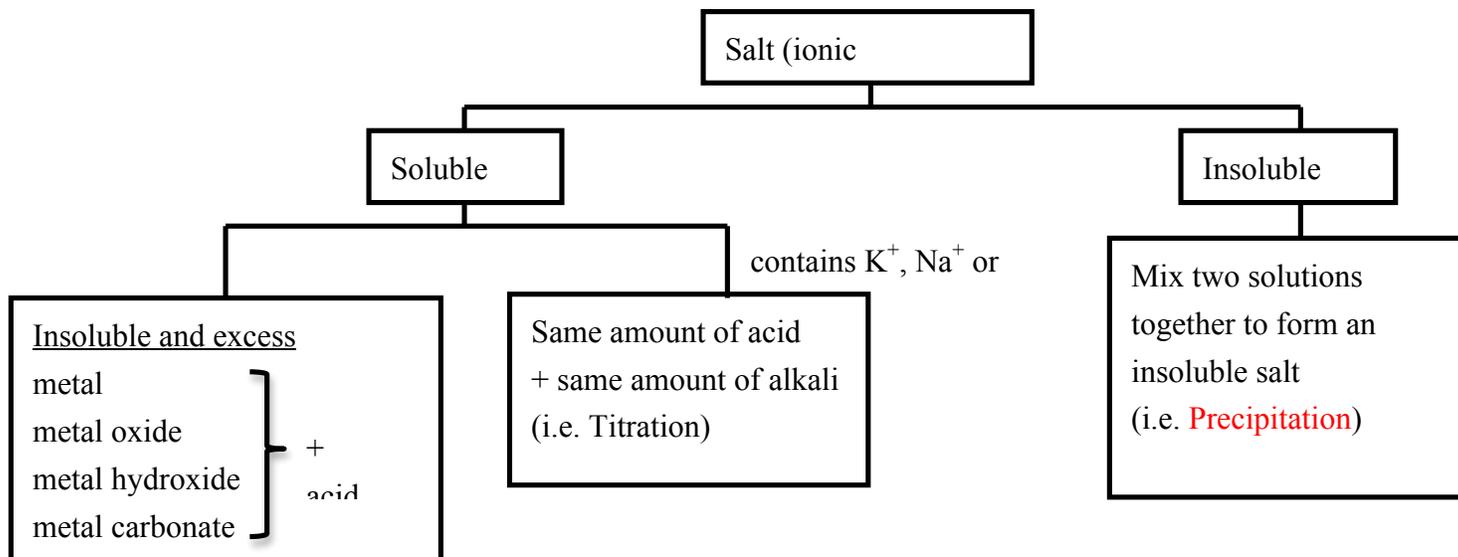

### Summary

Method 1 ( $\text{Pb}(\text{NO}_3)_2 + \text{Na}_2\text{SO}_4$ ) can produce pure  $\text{PbSO}_4$  after further treatment.

**General method of producing insoluble salt such as  $\text{PbSO}_4(\text{s})$**

Mix two solutions together to form a precipitate which is the insoluble salt (i.e. Precipitation)

### Summary of the first two methods of making soluble salt

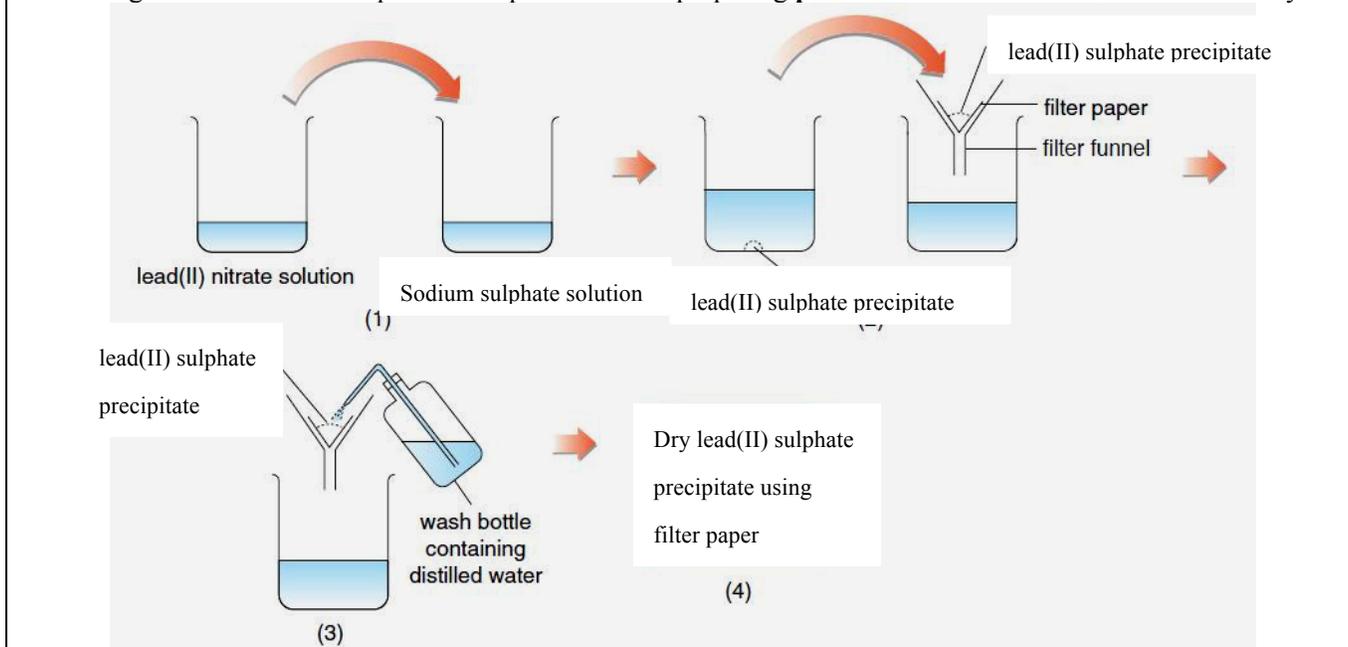

**Checkpoint – Suggest a suitable method for preparing particular salt**

Give a pair of reactants to prepare each of the following salts.

	Salt to be prepared	Soluble / insoluble	Reactants to prepare the salt
E.g.	MgCl <sub>2</sub>	Soluble	Excess MgO + dilute HCl
(a)	PbCl <sub>2</sub>	Insoluble	Pb(NO <sub>3</sub> ) <sub>2</sub> + NaCl
(b)	AgCl	Insoluble	AgNO <sub>3</sub> + NaCl
(c)	K <sub>2</sub> SO <sub>4</sub>	Soluble	KOH + H <sub>2</sub> SO <sub>4</sub>
(e)	ZnSO <sub>4</sub>	Soluble	Excess Zn / Zn(OH) <sub>2</sub> / ZnCO <sub>3</sub> + H <sub>2</sub> SO <sub>4</sub>

**Writing experimental procedures for preparing a insoluble salt such as PbSO<sub>4</sub>**

Draw diagrams to show the experimental procedures of preparing **pure** insoluble salt PbSO<sub>4</sub> in the laboratory

**Describe** the experimental procedures of preparing pure PbSO<sub>4</sub> in the laboratory.

First, mix lead(II) nitrate solution and sodium sulphate solution together in a beaker. Second, filter the reaction

mixture (to) obtain the precipitate. Third, wash the precipitate with a large amount of distilled water.

Finally, dry the precipitate using filter paper.

### Take home exercises

(a) Salt to be prepared: **CuCl<sub>2</sub>**

Step 1: Is it soluble or insoluble? (*Refer to note P. 7*)

Soluble

Step 2: Deciding what reagents to be used.

Copper(II) oxide solid and hydrochloric acid

Step 3: Write a chemical equation, with state symbols, for the reaction involved.

Step 4: Describe how you would prepare a pure crystal of **CuCl<sub>2</sub>** in the laboratory.

First, add excess copper(II) oxide to the beaker with dilute hydrochloric acid and heat the reaction mixture. Secondly, Filter the excess copper(II) oxide to obtain the copper(II) chloride solution. Third, heat the copper(II) chloride solution to concentrate the solution until a saturated copper(II) chloride solution is formed. Fourth, leave the saturated copper(II) chloride solution at room temperature overnight. Fifth, filter the copper(II) chloride solution to obtain the crystal. Sixth, wash the crystals with a little cold distilled water. Finally, dry the crystals using filter paper

(b) Salt to be prepared: **MgCO<sub>3</sub>**

Step 1: Is it soluble or insoluble? (*Refer to note P. 7*)

insoluble

Step 2: Deciding what reagents to be used.

Magnesium nitrate solution and sodium carbonate solution

Step 3: Write a chemical equation, with state symbols, for the reaction involved.

Step 4: Describe how you would prepare a pure crystal of **MgCO<sub>3</sub>** in the laboratory.

First, Mix magnesium nitrate solution and sodium carbonate solution together in a beaker. Second, filter the reaction mixture to obtain the precipitate. Third, wash the precipitate with a **large amount of** distilled water.

Finally, dry the precipitate using filter paper.
